

## HIGH OLEIC SOYBEANS

# A Perfect Partner for Double-Crop Opportunities

**LOOKING FOR WAYS TO MAXIMIZE YOUR FARM'S PROFIT POTENTIAL? CONSIDER PLANTING HIGH OLEIC SOYBEANS IN A DOUBLE-CROP SYSTEM. HERE ARE JUST A FEW OF THE MANY ADVANTAGES WAITING FOR YOU.**

**Premium opportunity** – Domestic demand for high oleic soybeans is growing rapidly and farmers can earn premiums ranging from \$0.90 to \$1.25 per bushel, depending on where you market your soybeans.

**Regional advantage** – If you farm in areas where double-cropping is practical, you have an advantage over regions where only one planting is possible, particularly in Delmarva.

**Maximize profit potential/acre** – Why not make your land work harder for you? A double-crop system provides a unique opportunity to enhance your profitability on a per acre basis.

**Wheat as a cover crop** – Wheat offers a great opportunity to grow a cash crop that doubles as a cover crop. There are numerous soil health benefits to cover crops, and soybeans following wheat is a terrific option.

**Ideal follow-up crop to cereals** – With cereals harvest typically done by late summer — depending on weather conditions — you still have ample time to raise a crop.

**No significant difference from planting full-season varieties** – Agronomic practices don't really change between a double-crop or a full-season planting system. Keep an eye on typical management variables — soil moisture, weed pressure, planting depths, row spacing — and you're all set.

**TALK TO YOUR CROP ADVISOR OR FARM MANAGER TO SEE IF PLANTING HIGH OLEIC SOYBEANS MAKES SENSE FOR YOUR OPERATION.**
